5198 users solved this problem. Latest completion was about 3 hours ago.

Objects of the class `Mountain` have an attribute `height` defined in its constructor. The value is initially given in **meters**.

Create a method `convert_height` that converts the height of the mountain from meters to feet according to the formula $Foot = Meter / 0.3048$ and then returns the calculated value. This method doesn't take any attributes except for `self`.

Write a program

[Code Editor](#) [IDE](#)

Python

```
1 class Mountain:
2     def __init__(self, name, height):
3         self.name = name
4         self.height = height
5
6     # create convert_height here
7     def convert_height(self):
8         return self.height / 0.3048
9
```

✓ Correct.
