 users solved this problem. Latest completion was about 2 hours ago.

If we execute the following code, a value of which data type will end up stored in the variable *b*?

```
1 a = "Tuesday"
2 b = 10
3 a = b
4 b = a
```

In other words, if we call:

```
1 print(type(b))
```

after executing the code, which type will be printed?

Report a typo

Select one option from the list

- ☐ None – Python will throw an error, because we tried to assign int value to the string variable.
- ☐ float
- ☐ str
- ☐ int
- ☐ None – the variable will not be defined.

✓ Correct.
