

# Connectivity in graphs → The number of connected components

Hard 1 minute

161 users solved this problem. Latest completion was about 16 hours ago.

Given below is an undirected graph:

What is the number of connected components the graphs consists of?

Report a typo

Enter a number

5

Correct.

Thanks for your feedback!

Note that a connected component can consist of only one node. This doesn't contradict the definition in the theory that says: "each pair of nodes in this subgraph is connected". If you want to learn more about why it happens, read this article <https://www.quora.com/What-is-vacuous-truth> otherwise just treat it as a part of the definition.
