

Python → Modules and packages → [Create module](#)

Create module → Function main()

Medium 1 minute ?

2266 users solved this problem. Latest completion was 19 minutes ago.

Let’s say you need a module that:

- stores a string variable *n* with the value "42".
- prints a string "N: 42" *only if* it is executed as a script.

Put the lines of this module’s code in the correct order and add indents.

Report a typo

✓ Rearrange the lines to make the code work. Use the arrow buttons to add indentation.
