# Type casting\_ → Lexical reduplication

Easy 1 minute

10984 users solved this problem. Latest completion was about 2 hours ago.

The languages of the world are amazing! Programming languages too, but now we will talk about the human ones. In linguistics, repeating a word or part of it is called *reduplication*. This morphological phenomenon is found in different languages. Think for a second, and you will definitely come up with a couple of examples. Just to name a few: *knock-knock, so-so, bye-bye*.

We have a full reduplication here since the entire word is repeated. That’s the mechanism we want you to implement. Print a word exactly 2 times. The spelling rules vary across the globe, so do not separate the halves (that will be easy!).

Hint

Report a typo

Sample Input 1:

maru

Sample Output 1:

marumaru

Sample Input 2:

piga

Sample Output 2:

pigapiga

Sample Input 3:

knock

Sample Output 3:

knockknock

Write a program

[Code Editor](#) [IDE](#)

```
1 word = input()
2
3 # Change the next line
4 print(word * 2)
5
```

Python

✓ Correct.

That’s an awesome solution! What do you think about showing it off? [Post it to Solutions](#) so other learners can enjoy it too.
