Advanced `input()` handling is used to read input directly into several variables, for example:

```
1 | x, y = input().split()
```

Use it to print the next message with the two input values: `"x of y"`

[Report a typo](#)

Sample Input 1:

state Massachusetts

Sample Output 1:

state of Massachusetts

Sample Input 2:

Queen Scots

Sample Output 2:

Queen of Scots

[Write a program](#)

[Code Editor](#) [IDE](#)

```
1 first, second = input().split()
2 print(f"{first} of {second}")
3
```

Python

✓ Correct.
