Class vs instance → Cities

📶 Medium   🕐 2 minutes ❔

What will be the value of `City.all_cities` after we run the code below?

```python
class City:
    all_cities = []

    def __init__(self, name, year):
        self.name = name
        self.year = year

ny = City("New York", 1624)
ny.all_cities.append("New York")

stockholm = City("Stockholm", 1187)

stockholm.all_cities = ["Stockholm"]
```

The answer should be a list in the square brackets [], for example, `["City", "Another City", "Third City"]`. Strings can be in single or double quotes, for example, `["City"]` or `['City']`.
