Python → Collections → Tuple

Tuple → Name

📊 Medium   🕐 2 minutes   ❓

From the input, you get the first and the last name of a person. Create a tuple with the full name: the first element should be the first name and the second element should be the last name. Save the resulting tuple to the variable `full_name`. Do NOT print anything!

The variables `first_name` and `last_name` have already been read from input.

Example. Suppose, `first_name` is `"John"` and `last_name` is `"Doe"`. The resulting tuple should be `("John", "Doe")`.

📄 Report a typo

↓ Write a program

Code Editor   **IDE**

```Python
1   first_name = input()
2   last_name = input()
3
4   # create full_name here
5   full_name = (first_name, last_name)
6
```

✓ Correct.
