Here are a class `Friend` and a couple of its instances. Some of those instances called the `set_best_friend` method.

```python
class Friend:
    def __init__(self, name):
        self.name = name
        self.best_friend = None

    def set_best_friend(self, bff_name):
        self.best_friend = bff_name

kate = Friend("Kate")

alex = Friend("Alex")

jess = Friend("Jess")

kate.set_best_friend("Melani")

jess.set_best_friend("Kate")

kate.set_best_friend("Jess")
```

What will be the output of this code?

```python
print(kate.best_friend)
```
