Python → Functions → Arguments

Arguments → Interchange

▪ Easy   ◷ 1 minute   ❓

Here is a function called `pow()`:

```
1   def pow(x, y):
2       return x ** y
```

It returns **x** raised to the power **y**. For two function calls `pow(2, 3)` and `pow(3, 2)`, calculate the sum of the two returned numbers.
